# Clouds and Trust

- ▶ The promises of the cloud are substantial
  - ▶ reduced hardware and software costs
  - ▶ reduced resource consumption
  - ▶ improved availability and reliability
- ▶ The structure of the cloud complicates assurance
  - ▶ not under the desk
  - ▶ ambiguous and changing runtime environment
  - ▶ unknown and unknowable actors in the same environment
- ▶ Is trust possible in the cloud environment?
  - ▶ unambiguous identification
  - ▶ confirmation of uninhibited execution
  - ▶ direct or trusted indirect observation of good behavior

# Virtual Blinking Lights

Provide new capabilities that establish and maintain trustworthy cloud-based application deployment

- ▶ Establish trust in cloud applications
  - ▶ trust in cloud infrastructure
  - ▶ trust in user-space applications
  - ▶ trust in application cohorts
- ▶ Promote informed decision making
  - ▶ confirm data confidentiality
  - ▶ confirm execution and data integrity
- ▶ Autonomous run-time response and reconfiguration
  - ▶ respond to attack, failure, reconfiguration, and repair
  - ▶ appraisal informs response

# Semantic Remote Attestation

- ▶ Appraiser requests a quote
  - ▶ specifies needed information
  - ▶ provides a nonce
- ▶ Target gathers evidence
  - ▶ measures application
  - ▶ gathers evidence of trust
- ▶ Target generates quote
  - ▶ measurements and evidence
  - ▶ original nonce
  - ▶ cryptographic signature
- ▶ Appraiser assesses quote
  - ▶ good application behavior
  - ▶ infrastructure trustworthiness

# Trusted Platform Module

- ▶ Provides and Protects Roots of Trust
  - ▶ Storage Root Key (SRK) - root of trust for storage
  - ▶ Endorsement Key (EK) - root of trust for reporting
- ▶ Quote generation
  - ▶ high integrity quotes - ( $\{RS\}_{AIK^-}$ , SML,  $\{n, PCRCComp\}_{AIK^-}$ )
  - ▶ high integrity evidence - ( $\langle E, n \rangle$ ,  $\{|\langle E, n \rangle|, PCR\}_{AIK^-}$ )
- ▶ Sealing data to state
  - ▶  $\{D, PCR\}_{K^+}$  will not decrypt unless PCR = current PCR
  - ▶ data is safe even in the presence of malicious machine
- ▶ Binding data to TPMs and machines
  - ▶  $(\{K^-\}_{SRK^+, K}) - \{D\}_{K^+}$  cannot be decrypted unless  $SRK^-$  is installed
  - ▶  $(\{J^-\}_{K^+, J}) - \{D\}_{J^+}$  cannot be decrypted unless  $K^-$  and  $SRK^-$  are installed

# Enabling Technologies

- ▶ Trustworthy protocol execution
  - ▶ executable and analyzable protocol representation
  - ▶ generates evidence of trustworthiness
  - ▶ negotiates attestation details
  - ▶ designed for highly focused appraisal
- ▶ Application specific measurement
  - ▶ managed and traditional execution environments
  - ▶ compile-time assistance for measurer synthesis
  - ▶ specialized measurement bundled with applications
- ▶ Lightweight trust infrastructure
  - ▶ abstract communications capability
  - ▶ migration support
  - ▶ strong identity

# Armored Application Architecture

M&A targeted to an application

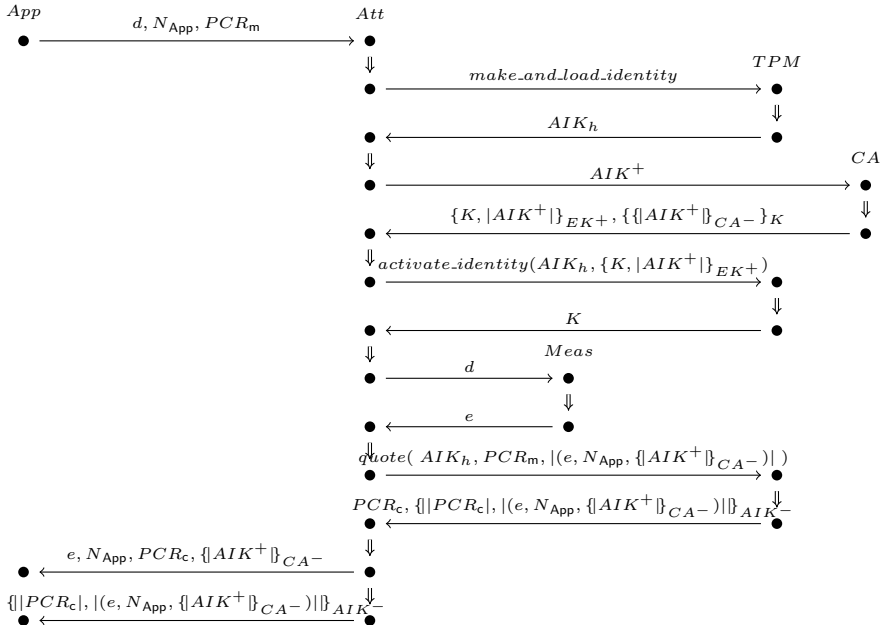

- ▶ Appraiser makes attestation requests
- ▶ Attester responds to attestation requests
- ▶ Measurer gathers evidence from application
- ▶ Influenced by the *Trusted Research Platform* and *Principles of Remote Attestation*

# System-Level Architecture

# Privacy CA Attestation

# EDSL for Protocol

## First-class protocol structures

- ▶ First-class structure for protocols
  - ▶ encapsulates a protocol-centered computation
  - ▶ semantics provide a basis for static analysis
  - ▶ based loosely on the Reader monad
- ▶ Abstract communication primitives
  - ▶ extended RPC-style capability
  - ▶ requests remote execution
  - ▶ defines `send` and `receive` operations
  - ▶ abstracts away communication details

```
do {  
    f(x);  
    y <- f(x);  
    send a x;  
    y <- receive a  
}
```

# Negotiating a Protocol

Respecting privacy

- ▶ Typical negotiation
  - ▶ request sent to Attester
  - ▶ Attester generates proposal
  - ▶ Appraiser selects protocol
  - ▶ Attester executes protocol
- ▶ Three kinds of requests
  - ▶ execute protocol 22
  - ▶ provide {OS\_config, http\_stat, firewall\_stat}
  - ▶ execute protocol do { ... }
- ▶ Three negotiation criteria
  - ▶ ability to satisfy the request
  - ▶ satisfaction of appraiser and attester privacy policies
  - ▶ previously obtained evidence

# Negotiation Protocol

## Request and Select

- ▶ Requests an attestation
- ▶ Receives proposals
- ▶ Selects from proposals

```
do { send t r;  
      q <- receive t;  
      e <- case {p:q | (policy? p)} of  
            ∅ : None  
            p : send t (choose p)  
            end;  
      case e of  
        Some v : (appraise v)  
        None : None  
      end }
```

Negotiation is a protocol that can itself be selected or negotiated

# Negotiation Results

- ▶ Evidence and Protocol pairs
- ▶ Satisfies privacy policy of attester
- ▶ Provide some or all of requested information

```
((ID,SIGHASH,SIGSRC),  
  do { id <- getVCID;  
        sig <- getSigFileEvidence;  
        src <- getSigFileSrc;  
        e <- createEvidence(id,sig,src);  
        returnEvidence(e) })
```

# Reified Protocol

Generated negotiation protocol code (currently by hand):

```
P = CreateChannel (AChannel "attesterChan") Target
  $ Send ANRequest (AChannel "attesterChan")
  $ Receive (Var "counterOffer") (AChannel "attesterChan")
  $ CalculateFinalRequest (Var "finalReq")
                        ANRequest
                        (Var "counterOffer")
  $ Send (Var "finalReq") (AChannel "attesterChan")
  $ Receive (Var "finalConfirmation")
            (AChannel "attesterChan")
  $ Case (Var "finalConfirmation") [(Var "finalReq")]
        (HandleFinalChoice (Var "result") (Var "finalReq")
        (Result (Var "result")))
        (Stuck "finalConf and finalReq match error")
```

# Performing Measurement and Attestation

# Single Realm Attestation

Protocol for gathering virus checker evidence

```
do { id <- getVCID;  
    sig <- getSigFileEvidence;  
    src <- getSigFileSrc;  
    e <- createEvidence(id,sig,src);  
    returnEvidence(e) }
```

and generates evidence of the form:

$$\langle (id, sig, src), \{ |(id, sig, src)|, PCRComp_0 \}_{AIK_0^-} \rangle$$

Appraisal replays the protocol up to crypto operations with known good measurements

# Multi-Realm Attestation

Nested attestation requests evidence from the signature server directly:

```
do { id <- getVCID;  
    sig <- getSigFileEvidence;  
    src <- getSigFileSrc;  
    srcEvidence <- send src r;  
    e <- createEvidence(id,sig,src,srcEvidence)  
    returnEvidence(e)  
}
```

and generates bundled evidence:

$$\text{let } b = \langle (e), \{ |e|, PCRComp_1 \}_{AIK_1^-} \rangle \text{ in}$$
$$\langle (id, sig, src, b), \{ | (id, sig, src, b) |, PCRComp_0 \}_{AIK_0^-} \rangle$$

# Trusting Evidence

Why bundling is hard

- ▶ Trusting evidence
  - ▶ hashes and TPM quotes
  - ▶ measure and appraise the attestation infrastructure
  - ▶ gather evidence of good protocol execution
- ▶ Trusting bundled evidence
  - ▶ appraisers do not know the source of evidence *a priori*
  - ▶ no global name space for evidence sources
  - ▶ bundled appraisals vs bundled evidence
- ▶ Trusting the appraiser
  - ▶ negotiated protocols must satisfy privacy policies
  - ▶ trust may not be transitive for applications and infrastructure
  - ▶ global policy is not an answer

# Current Status

Demos available

- ▶ Attestation and Appraisal development
  - ▶ CA-Based attestation protocol execution example
  - ▶ simple dynamic appraisal of attestation results
  - ▶ integrated negotiation protocol and attestation protocols
- ▶ Measurement development
  - ▶ HotSpot-based Java VM run time measurements
  - ▶ detect and report several runtime anomalies
  - ▶ standard mechanism for extending measurement capabilities
- ▶ Infrastructure development
  - ▶ vchan, TCP/IP and socket communication infrastructure
  - ▶ initial certificate authority implementation
  - ▶ language-based interface with TPM 1.2
  - ▶ integrated Berlios TPM emulator
  - ▶ JSON-based data exchange formats

# Ongoing Work

## Goals for 2015

- ▶ Establish roots-of-trust and trust argument
  - ▶ measured launch and remeasurement of ArmoredSoftware
  - ▶ establish trust in the Xen/OpenStack infrastructure
- ▶ Executable protocol representation and protocol semantics
  - ▶ evidence of proper execution
  - ▶ static trust analysis
  - ▶ protocol-centered appraisal
- ▶ More capable measurement
  - ▶ compiler directed measurement
  - ▶ continuous measurement—tripping and trending
- ▶ Publicly available libraries and infrastructure
